Anadromous species (ATLANTIC salmon, sea-run brown trout, American shad, alewife)	11

## INTRODUCTION

*The State of Connecticut has used fish-culture techniques to augment, enhance and/or restore populations of native and introduced fish species for over one hundred years. Currently, cultured salmonid species are brown trout, brook trout, rainbow trout, “tiger” trout (a brown trout/brook trout hybrid), Atlantic salmon and kokanee salmon (a landlocked form of the anadromous Pacific sockeye salmon). The DEP has established, and is currently expanding popular fisheries for walleye and northern pike by stocking fingerlings. The DEP also began a channel catfish stocking program in 2007. Anadromous clupeids (American shad and alewife) are being transplanted in efforts to restore runs.*

**TROUT:** DEP stocks trout into waters that have suitable habitat and are open to public fishing.

In 2009, the Inland Fisheries Division stocked over 702,000 adult and “specialty” trout in 199 rivers and streams and 102 lakes and ponds. Adult trout are 9-12 inches in length. Specialty trout are larger, generally in the 12-14 inch range, but some are larger including broodstock weighing 2-10 pounds. DEP also stocked 35,000 yearlings (7-9 inch trout), and 365,000 fry and fingerlings (1-6 inch trout). In 2009, approximately 53% of the adult trout stocked were brown trout, 29% were rainbow trout, and 18% were brook trout. Specialty trout were mostly larger brown trout and rainbow trout, but also included 8,500 10-12 inch “tiger” trout (a brook trout /brown trout hybrid).

Springtime trout distribution generally begins in early March and continues through the end of May. More than half the year’s trout are stocked prior to opening day (382,000 trout in 2009). Due to its favorable temperatures and flows, the Farmington River is often stocked for summer holidays. The Farmington River was stocked with 2,500 trout for the Labor Day weekend. Additionally, with cool temperatures and plentiful flows statewide in 2009, Trout Management Areas on five other rivers were also stocked for Labor Day. Approximately 29 lakes and 15 rivers (including a number of Trout Management Areas and most Trout Parks) were stocked again in September and October to enhance fall and winter trout fishing. In 2009, over 37,000 trout were stocked in the fall.

Innovative management tools such as minimum lengths, reduced creel limits, catch-and-release only areas and wild trout areas are used to enhance angler opportunities in selected waters. Although these special management areas (Trout Parks, Trophy Trout Streams & Lakes, Trout Management Areas, Wild Trout Management Areas and Urban Ponds) are perhaps the most noticeable and popular trout fishing areas, two-thirds of the catchable-sized trout stocked in Connecticut are released into “open areas” (where no special regulations apply).

**KOKANEE SALMON:** Kokanee are a land-locked form of the Pacific sockeye salmon. The DEP currently maintains a kokanee salmon fishery in West Hill Pond (New Hartford/Barkhamsted). Mature kokanee are trapnetted from West Hill Pond and transported to the Burlington State Trout Hatchery for spawning during the fall. Additional eggs are sometimes obtained from out-of-state sources (when available) to reach stocking goals (approximately 50,000 fry per year) and/or to add genetic diversity. After eggs are incubated and hatched, kokanee fry are reared and stocked in the spring. In 2009, nearly 51,000 fry were released into West Hill Pond.

Historically, popular kokanee fisheries also existed in East Twin Lake and Lake Wononskopomuc, however, these two fisheries collapsed following illegal introductions of landlocked alewife. When surplus eggs are available, fry are also stocked into East Twin Lake and/or Lake Wononskopomuc. In 2009, 51,400 fry were released into East Twin Lake and 25,800 fry were released into Lake Wononskopomuc. The great news for anglers is that a strong kokanee population has returned to East Twin Lake. In 2008, large adults were sampled for the first time in many years, and in 2009 over 800 16-inch adult salmon were sampled. The return of kokanee in East Twin Lake may be related to a concurrent decline of the lake's alewife population. There is hope that a very exciting and popular kokanee fishery can be reestablished at East Twin Lake.

**NORTHERN PIKE:** Northern pike fisheries are developed and maintained by stocking fingerlings (3 – 8 inch pike) that are raised in managed marshes. Pike reproduction and fry survival are maximized by managing water levels, vegetation types and by limiting undesirable fish species in marshes in Haddam, Kent, Litchfield and Mansfield. Juvenile pike produced from the managed marshes are stocked into Bantam Lake (beginning in the 1970's), the CT River (beginning in the 1970's), Mansfield Hollow Reservoir (since 1992), Pachaug Pond (since 1999), Quaddick Reservoir (since 1999) and Winchester Lake (since 2001). Any surplus fingerlings are stocked into Lake Lillinonah. Nearly 9,700 pike fingerlings were stocked in 2009. Pike fingerlings were not stocked into Mansfield Hollow Reservoir during 2009 and 2008 in order to evaluate production due to natural spawning outside the managed marshes.

**WALLEYE:** DEP began to develop walleye fisheries in 1993. Walleye fisheries are created by annual stockings of 4 to 6 inch fingerlings at rates of 8-15 per acre in each lake. Walleye fingerlings are obtained from suppliers located in the Mid-West. The fisheries in each lake are evaluated by monitoring the growth and abundance of walleyes and other fish species and by monitoring angler effort and fishing success. Currently, walleye fisheries are established in nine public lakes and ponds (Gardner Lake, Squantz Pond, Lake Saltonstall, Saugatuck Reservoir, Batterson Park Pond, Beach Pond, Coventry Lake, Lake Housatonic and Mashapaug Lake). The walleye for Lake Saltonstall and Saugatuck Reservoir are purchased by their respective water companies, South Central CT Regional Water Authority (SCCRWA) and Aquarion Water Company. DEP also stocks walleye and monitors their populations in Lake Pocotopaug (fish for this lake are purchased by the Town of East Hampton). In 2009, DEP stocked 26,900 walleye fingerlings into seven public lakes (Gardner Lake, Squantz Pond, Saugatuck Reservoir, Batterson Park Pond, Beach Pond, Coventry Lake and Mashapaug Lake). Lake Saltonstall (economic decision by SCCRWA) and Lake Housatonic (management reassessment by DEP) were not stocked in 2009.

**CHANNEL CATFISH:** In 2007, DEP began a channel catfish stocking program in an effort to provide an additional year-round fishery for a large game fish. This was the first time that the DEP has released catfish into state waters. In 2009, over 9,900 catfish (9-1 inch fish) were released into Lower Bolton Lake (Bolton), Maltby Lakes 2 & 3 (Orange/West Haven), Pataconk Lake (Chester), Black Pond (Middlefield), Quonnipaug Lake (Guilford), Lake Wintergreen (Hamden/New Haven) and Silver Lake (Berlin/Meriden). More than 5,200 larger catfish (14-2 inch fish) were stocked into five locations of the new Urban Fishing Program, Bunnells Pond (Bridgeport), Keney Park Pond (Hartford), Lake Wintergreen (Hamden/New Haven), Mohegan Park Pond (Norwich) and Lakewood Lake (Waterbury). DEP currently

plans to stock catfish annually and both the channel catfish stocking and the Urban Fishing programs will be assessed for effectiveness after several years.

**BROODSTOCK ATLANTIC SALMON FISHERY:** Beginning in 1992, DEP has stocked surplus broodstock Atlantic salmon into the Naugatuck and Shetucket Rivers to provide a recreational fishery for Atlantic salmon. These salmon are raised in hatcheries to provide eggs for the Connecticut River Atlantic Salmon Restoration Program and are the progeny of sea-run salmon that returned to the Connecticut River. The stocked salmon are either barren (without eggs) or surplus spawned fish that will be replaced by younger salmon. Stocked broodstock Atlantic salmon are two to five years old and generally weigh between 2 and 20 pounds each. The number of stocked broodstock can vary widely from year to year, generally ranging from 800 to 1600 fish.

DEP has also stocked several lakes with broodstock Atlantic salmon each year beginning in 2007. Due to insufficient stream flows in October, 2007, the first group of salmon scheduled for the Shetucket River were instead released into Beach Pond (Voluntown) and Crystal Lake (Ellington). Data collected following these stockings indicated that salmon fishing in lakes might be popular. In 2008, the DEP stocked Mashapaug Lake and Crystal Lake on an experimental basis to collect additional data, which also indicated that stocking these salmon had created a popular fishery. In 2009, salmon were stocked into four lakes, Beach Pond and Mashapaug Lake in April, and Mount Tom Pond and Crystal Lake in October.

A total of 1,584 broodstock salmon, all produced by DEP's Kensington Hatchery, were stocked in 2009. Due to the need to perform maintenance of the hatchery ponds at Kensington, DEP departed from its traditional stocking regime (stocking salmon on multiple occasions from mid-October into late November or even later). Instead, 400 surplus salmon were stocked out in April, and the remaining 1,184 fish were stocked out during a four day period in mid-October. The fish released in October were also not as large as many of the salmon stocked in the previous years. All fish released were younger salmon, between two and three years old, ranging in weight from 2 to 5 pounds each.

**ATLANTIC SALMON RESTORATION PROGRAM:** Each year the DEP stocks over one million juvenile salmon (fry, parr and smolts) as part of the effort to restore Atlantic salmon to the Connecticut River watershed. In 2009, more than 1,107,000 fry, 3,900 parr and 44,100 smolts were stocked into Connecticut River tributaries (the Farmington, Salmon and Eightmile River systems). Anglers are reminded that fishing for Atlantic salmon in Connecticut is prohibited with the exception of the broodstock fisheries (see above).

**SEA-RUN BROWN TROUT:** DEP continues efforts to develop and enhance runs of sea-run trout in selected coastal streams. In 2009, 90,000 juvenile brown trout (fry and parr) were stocked into streams with suitable habitat. Additionally, nearly 3,400 yearling brown trout and 3,100 yearling tiger trout were released into five coastal streams.

**RESTORATION AND ENHANCEMENT OF ANADROMOUS CLUPEIDS:** DEP is actively working to restore and enhance anadromous American shad, alewife and blueback herring runs in Connecticut by removing obsolete dams, building fishways that allow fish to migrate past remaining dams, and transplanting pre-spawn adults from streams with healthy runs to targeted rivers having suitable habitat and water quality. In 2009, 1,051 American shad and 5,036 alewife were transplanted.

**CT-DEP INLAND FISHERIES DIVISION, ANNUAL DISTRIBUTION REPORT FOR FISH STOCKED IN 2009**
